

GRADE tables: Comparison of cell-based influenza vaccine with high-dose egg-based influenza vaccine in adults aged ≥ 65 years

NCIRS is conducting GRADE assessments in support of the Australian Technical Advisory Group on Immunisation (ATAGI) and making results available on the Centre's website. Please read this material as a supplement to the [Australian Immunisation Handbook influenza chapter](#).

Cell-based influenza vaccine compared with high-dose egg-based influenza vaccine in adults aged ≥ 65 years																									
Outcomes	Impact	No of participants (studies)	Certainty of the evidence (GRADE)	Interpretation																					
CRITICAL OUTCOMES																									
Influenza-related hospitalisation/emergency department (ED) visits Assessed with: ICD coded J09.xx, J10.xx, J11.xx, and J129 Follow-up: 12 months	<p>Relative vaccine effectiveness of influenza-related hospitalisation/ED visits for clIV vs hd-llV</p>  <table border="1"> <caption>Data from Forest Plot: Relative vaccine effectiveness of influenza-related hospitalisation/ED visits for clIV vs hd-llV</caption> <thead> <tr> <th>Study</th> <th>Relative Risk (95% CI)</th> <th>Population</th> </tr> </thead> <tbody> <tr> <td>Izurieta et al (2019) ≥65 years, hospital/ED</td> <td>0.977 (0.947 - 1.007)</td> <td>9,148,408</td> </tr> <tr> <td>Izurieta et al (2020) ≥65 years, hospital/ED</td> <td>1.044 (1.014 - 1.074)</td> <td>2,854,219</td> </tr> <tr> <td>Izurieta et al (2021) ≥65 years, hospital/ED</td> <td>1.042 (1.012 - 1.072)</td> <td>7,997,697</td> </tr> <tr> <td>Izurieta et al (2019) ≥65 years, hospitalised</td> <td>1.007 (0.977 - 1.037)</td> <td>9,148,408</td> </tr> <tr> <td>Izurieta et al (2020) ≥65 years, hospitalised</td> <td>1.02 (0.99 - 1.05)</td> <td>2,854,219</td> </tr> <tr> <td>Izurieta et al (2021) ≥65 years, hospitalised</td> <td>1.035 (1.005 - 1.065)</td> <td>7,997,697</td> </tr> </tbody> </table> <p>Note: In all studies, clIV4 is compared with hd-llV3 Total participants = 20,000,324 (3 observational studies)¹⁻³</p>	Study	Relative Risk (95% CI)	Population	Izurieta et al (2019) ≥65 years, hospital/ED	0.977 (0.947 - 1.007)	9,148,408	Izurieta et al (2020) ≥65 years, hospital/ED	1.044 (1.014 - 1.074)	2,854,219	Izurieta et al (2021) ≥65 years, hospital/ED	1.042 (1.012 - 1.072)	7,997,697	Izurieta et al (2019) ≥65 years, hospitalised	1.007 (0.977 - 1.037)	9,148,408	Izurieta et al (2020) ≥65 years, hospitalised	1.02 (0.99 - 1.05)	2,854,219	Izurieta et al (2021) ≥65 years, hospitalised	1.035 (1.005 - 1.065)	7,997,697		$\oplus\oplus\ominus$ Moderate ^{a,b}	Cell-based influenza vaccine likely results in no difference in influenza-related hospitalisations/ED visits compared with high-dose egg-based influenza vaccine.
Study	Relative Risk (95% CI)	Population																							
Izurieta et al (2019) ≥65 years, hospital/ED	0.977 (0.947 - 1.007)	9,148,408																							
Izurieta et al (2020) ≥65 years, hospital/ED	1.044 (1.014 - 1.074)	2,854,219																							
Izurieta et al (2021) ≥65 years, hospital/ED	1.042 (1.012 - 1.072)	7,997,697																							
Izurieta et al (2019) ≥65 years, hospitalised	1.007 (0.977 - 1.037)	9,148,408																							
Izurieta et al (2020) ≥65 years, hospitalised	1.02 (0.99 - 1.05)	2,854,219																							
Izurieta et al (2021) ≥65 years, hospitalised	1.035 (1.005 - 1.065)	7,997,697																							

Cell-based influenza vaccine compared with high-dose egg-based influenza vaccine in adults aged ≥ 65 years
Patient or population: Adults aged ≥ 65 years

Intervention: Cell-based inactivated influenza vaccine (clIV)

Comparison: High-dose egg-based inactivated influenza vaccine (hdIIV)

Outcomes	Impact	No of participants (studies)	Certainty of the evidence (GRADE)	Interpretation
IMPORTANT OUTCOMES				
Influenza-related primary care/outpatient visits Assessed with: rapid influenza diagnostic test followed by a therapeutic course of oseltamivir prescribed within 2 days of test Follow-up: 12 months	Relative vaccine effectiveness clIV4 vs hd-IIV3 Izurieta 2019, ages ≥ 65 years: rVE 11.5% (95% CI: 7.9, 15.0)	N = 9,148,408 (1 observational study) ¹	⊕○○○ Very low ^{a,c}	The evidence suggests that cell-based influenza vaccine may result in a slight reduction in influenza-related primary care/outpatient visits compared with high-dose egg-based influenza vaccine.

Cell-based influenza vaccine compared with high-dose egg-based influenza vaccine in adults aged ≥65 years
Patient or population: Adults aged ≥65 years

Intervention: Cell-based inactivated influenza vaccine (cIIV)

Comparison: High-dose egg-based inactivated influenza vaccine (hdIIV)

Outcomes	Impact	No of participants (studies)	Certainty of the evidence (GRADE)	Interpretation
Explanations				
a. Downgraded due to potential confounding. b. Downgraded due to wrong comparator. c. Downgraded due to lack of data from other studies.				
<i>Abbreviation:</i> CI=confidence interval; ED=emergency department				
GRADE Working Group grades of evidence				
<p><i>High certainty:</i> We are very confident that the true effect lies close to that of the estimate of the effect.</p> <p><i>Moderate certainty:</i> We are moderately confident in the effect estimate: the true effect is likely to be close to the estimate of the effect, but there is a possibility that it is substantially different.</p> <p><i>Low certainty:</i> We have limited confidence in the effect estimate: the true effect may be substantially different from the estimate of the effect.</p> <p><i>Very low certainty:</i> We have very little confidence in the effect estimate: the true effect is likely to be substantially different from the estimate of effect.</p>				

Evidence profile

Cell-based influenza vaccine compared with high-dose egg-based influenza vaccine in adults aged ≥ 65 years

Certainty assessment							Impact	Certainty	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations			

Influenza-related hospitalisation/ED visits (follow-up: 12 months; assessed with: ICD coded J09.xx, J10.xx, J11.xx, and J129)

3	Observational studies	Serious ^a	Not serious	Not serious ^b	Not serious	None	clIV vs hd-IIV rVE (95% CI): Izurieta et al (2019), ≥ 65 years, hospital/ED: 2.3% (-0.8–5.3) Izurieta et al (2020), ≥ 65 years, hospital/ED: -4.4% (-9.2–0.2) Izurieta et al (2021), ≥ 65 years, hospital/ED: -4.2% (-9.4–0.8) Izurieta et al (2019), ≥ 65 years, hospitalised: -0.7% (-4.8–3.4) Izurieta et al (2020), ≥ 65 years, hospitalised: -2.0% (-8.2–3.9) Izurieta et al (2021), ≥ 65 years, hospitalised: -3.5% (-9.4–0.8) 1-3	⊕⊕⊕○ Moderate	CRITICAL

Evidence to decision framework

Cell-based influenza vaccine compared with high-dose egg-based influenza vaccine in adults aged ≥65 years

PICO Question					
Population	Adults 65 years and over				
Intervention	Cell-based influenza vaccine (cIV)				
Comparison	Adjuvanted egg-based influenza vaccine (hDIIIV)				
Main outcomes	<ul style="list-style-type: none"> Laboratory-confirmed influenza hospitalisation Influenza-related hospitalisation/emergency department visits Pneumonia-related hospitalisation/emergency department visits Laboratory-confirmed influenza Influenza-related medical encounter (IRME) Local adverse events Systemic adverse events Serious adverse events (SAE) 				
Setting	Global middle- to high-income settings (e.g. Europe, Canada, US, Australia)				
Assessment					
Problem	<i>Is the problem a priority?</i>				
Don't know	Varies	No	Probably no	Probably yes	Yes
<ul style="list-style-type: none"> Influenza causes substantial morbidity and mortality. 					
Desirable effects	<i>How substantial are the desirable anticipated effects?</i>				
Don't know	Varies	Large	Moderate	Small	Trivial

- There is insufficient evidence to demonstrate that clIV is more protective than hdIIV for either critical or non-critical influenza outcomes.
- Studies in this GRADE included influenza season data from the Northern Hemisphere 2017/18 – 2019/20. Notably, separate studies examining antigenic differences between the circulating virus strains and those included in the vaccine have demonstrated that during 2017/18 and 2018/19 seasons respectively, only 48% and 19% of viruses tested were well-inhibited by the egg-based vaccine for influenza A(H3N2).⁴⁻⁷ This factor may have been related to improved vaccine effectiveness (VE) of clIV over allIV in 2017/18 where influenza A(H3N2) was in high circulation in the United States (Northern Hemisphere).⁶
- The northern hemisphere influenza season of 2017/18 used the same vaccine composition as that used in the southern hemisphere influenza season of 2017 where influenza A(H3N2) predominated and egg-adaptation was also thought to contribute to low overall VE in Australia.^{8,9}

Undesirable effects

How substantial are the undesirable anticipated effects?

Don't know	Varies	Large	Moderate	Small	Trivial
------------	--------	-------	----------	-------	---------

- There is no evidence comparing adverse events after clIV vs hdIIV.

Balance of effects

Does the balance between desirable and undesirable effects favour the intervention or the comparison?

Don't know	Varies	Favours comparison	Probably favours comparison	Does not favour either comparison or intervention	Probably favours intervention	Favours intervention
------------	--------	--------------------	-----------------------------	---	-------------------------------	----------------------

- There is insufficient evidence to balance desirable and undesirable effects when comparing clIV and hdIIV.

Certainty of evidence

What is the overall certainty of the evidence of effects?

No included studies	Very low	Low	Moderate	High
---------------------	----------	-----	----------	------

- The evidence is very uncertain about the effect of clIV on influenza outcomes compared with hdIIV.
- There is no direct comparative evidence on safety outcomes between clIV and hdIIV.

Values

Is there important uncertainty about or variability in how much people value the main outcomes?

Important uncertainty	Possibly important uncertainty or variability	Probably no important uncertainty or variability	No important uncertainty or variability
-----------------------	---	--	---

- Unlikely to be important uncertainty in how people value protection against influenza.

Acceptability <i>Is the intervention acceptable to key stakeholders?</i>					
Don't know	Varies	No	Probably no	Probably yes	Yes
<ul style="list-style-type: none"> As there is an influenza vaccination program already established for adults over 65 years, the introduction of a new vaccine is unlikely to affect acceptability. 					
Equity <i>What would be the impact on health inequities?</i>					
Don't know	Varies	Increased	Probably increased	Probably no impact	Probably reduced
<ul style="list-style-type: none"> No difference of impact on health inequities as funded influenza vaccine program already extends to disadvantaged and at-risk populations. 					
Feasibility <i>Is the intervention feasible to implement?</i>					
Don't know	Varies	No	Probably no	Probably yes	Yes
<ul style="list-style-type: none"> Minimal barriers in implementation as vaccine delivery system already in use. 					
ATAGI recommendation					
<p>High-dose egg-based influenza vaccine (hdIIV) is preferentially recommended over cell-based influenza vaccine (clIV) in adults aged over 65 years. However, clIV or standard-dose egg-based influenza vaccine (elIIV) may be given if the enhanced influenza vaccines (either hdIIV or adjuvanted influenza vaccine (alIIV)), currently recommended for adults over 65 years of age, are unavailable.</p>					
Justification and considerations					
<ol style="list-style-type: none"> 1. Due to contradictory studies, there is insufficient evidence demonstrating that clIV performs better on desirable outcomes than hdIIV. 2. There is a vast body of evidence that supports the use of enhanced influenza vaccines in adults aged over 65 years, while there is less evidence on the use of clIV in the older adult population. Previous GRADE assessments undertaken comparing high-dose influenza vaccines to standard-dose egg-based influenza vaccines have highlighted their improved protection against influenza illness and “enhanced” influenza vaccines are recommended as the preferred vaccines by ATAGI for adults aged over 65 years. 3. In the absence of comparative safety data on clIV vs hdIIV and variable desirable effects data, enhanced vaccines such as hdIIV or alIIV continue to be the preferred vaccines for this age group. 4. GRADE assessments of clIV have shown only a small incremental benefit compared with standard-dose egg-based influenza vaccine suggesting that either vaccine platform may be offered if the enhanced vaccines are unavailable.
